Heat Transfer · Worksheet 3

Conduction through plane walls · Sample document bundled with Nib

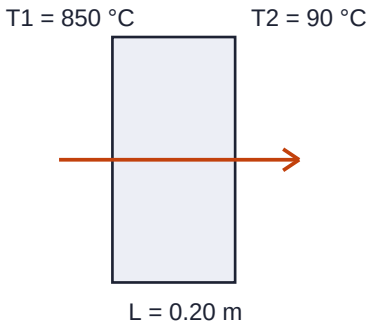
Name

Matriculation no.

☐ I solved these problems on my own

Problem 1

A furnace wall is 0.20 m thick with thermal conductivity k = 1.2 W/(m·K).
The inner surface is held at 850 °C and the outer surface at 90 °C.
Find the heat flux q'' through the wall using Fourier's law: q'' = k (T1 – T2) / L.



Problem 2

Add a 0.05 m insulation layer with k = 0.08 W/(m·K) on the outside.
Keeping the same surface temperatures, by what factor does the heat loss drop?

Tip: pick the pen and write your working on the lines. Fill the fields above with the hand tool.

Formula sheet

One-dimensional steady conduction

Fourier's law	$q'' = -k \frac{dT}{dx}$
Plane wall resistance	$R = \frac{L}{k A}$
Series walls	$R_{total} = R_1 + R_2 + \dots$
Convection resistance	$R = \frac{1}{h A}$
Heat rate	$q = \frac{\Delta T}{R_{total}}$
Cylinder wall	$R = \frac{\ln(r_2/r_1)}{2\pi k L}$

Notes

Sketch space

Draw the temperature profile for both problems
